We have the ability to blend with and blend away elements so that they disappear like ghosts in the background or when you move the layer you're working on. You can also add a slight vignette effect to narrow the borders of the image. You can also add a close-up effect that enlarges and blurs the image and soften the lines of the image. The vignette effect is great for several reasons. First, it can make an image "pop"; smaller text also look great when it's vignettted. It can also make a line drawing look like a watercolor painting. Each layer offers the ability to drag the element you want to use from the target area to its source area. You can move an element to its context by dragging it next to the blending options and effects menu (at the top left side of the image.) When you've completed your adjustments, click Done. When you're satisfied with the finished image, click Save and export it to your hard drive or device. If you don't save it, it will be deleted from the device. After you've made your selections and edits, the software will display all the different edits you can make. As you apply elements of the image, you'll see the settings and adjustments on the right side. You can adjust the brightness, contrast, and posterize dark areas in the images by clicking on the display button on the right side, or by selecting which colors should be adjusted. At the top of the editing pane, you can adjust the opacity of the image. You can change the resolution of the image from what is available to you at the time. As you do, the image will automatically adjust to fit your screen and scale to any aspect ratio you choose to set and you will be able to see it full screen. Select the image you want to export and click the "export" button and follow the prompts to finish the process.
